- In the Recovery and Backup process, I create copies of important files or system data to ensure they can be restored in case of system failure, data loss, or corruption. I also use recovery tools or restore points to bring the system back to its previous working state, making sure that operations can continue smoothly after unexpected issues.

2. Security and Access Control Implementation

- In setting up Group Policy, I configure rules and settings that control how users and computers behave in the network, such as setting password policies or limiting access to certain programs. For Security and Access Control Implementation, I assign permissions and user roles to make sure only authorized users can access specific files or systems, helping protect the network from unauthorized access and security threats.

4. Remote Administration Setup

- Remote Administration allows a user to access and control another computer over a network to manage files, settings, or troubleshoot issues without being physically present. Through this setup, the administrator can view the computer's properties, including CPU details, installed RAM, system type, and other hardware information.
